**CS 2209A — Applied Logic for Computer Science**

**Assignment 3**

Assigned: 7 November 2018

Due: 19 November 2018 (on OWL before midnight)

1. With the First Order Logic sentences given by  $\Gamma$  show  $\Gamma \vdash \exists x \text{Hate}(x, \text{Caesar})$  using resolution. Your answer must include each of the required steps to accomplish this proof. In the sentences below, predicates and constants start with an upper case letter and variables are lower case letters.

$$\Gamma = \left\{ \begin{array}{l} \text{Man}(\text{Marcus}) \\ \text{Roman}(\text{Marcus}) \\ \forall x (\text{Man}(x) \rightarrow \text{Person}(x)) \\ \text{Ruler}(\text{Caesar}) \\ \forall x (\text{Roman}(x) \rightarrow (\text{Loyal}(x, \text{Caesar}) \vee \text{Hate}(x, \text{Caesar}))) \\ \forall x \exists y \text{Loyal}(x, y) \\ \forall x \forall y ((\text{Person}(x) \wedge \text{Ruler}(y) \wedge \text{Tryassasin}(x, y)) \rightarrow \neg \text{Loyal}(x, y)) \\ \text{Tryassasin}(\text{Marcus}, \text{Caesar}) \end{array} \right\}$$

When performing the resolution step, use the following demonstration format:

- |             |   |
|-------------|---|
| 1. clause   | Given   |
| :           |   |
| k. clause   | Given   |
| k+1. clause | line number, line number, unifier (+ standardize variables apart) |
| :           |   |
| n. empty    | line number, line number, unifier (+ standardize variables apart) |
2. Given the following set of clauses, the implication graph that is generated by the DPLL algorithm with unit propagation, and the cut provided, give the learned clause generated by Conflict Directed Clause Learning and the backjump by stating the variable to backjump to. The notation in the graph is slightly different than what was used in the notes:  $w_1 \dots w_6$  label the clauses below and on the graph,  $x_1 \dots x_9$  are the propositional variables, each node in the implication graph has the following format: “propositional variable = truth value @ decision level in the tree”. The truth values are 0 for False, 1 for True. Any variables that have been given truth values because they are unit variables will have the same “decision level” as the variable that is a decision node.

$$\begin{aligned} w_1 &= (x_1 \vee x_2) \\ w_2 &= (x_1 \vee x_3 \vee x_7) \\ w_3 &= (\neg x_2 \vee \neg x_3 \vee x_4) \\ w_4 &= (\neg x_4 \vee x_5 \vee x_8) \\ w_5 &= (\neg x_4 \vee x_6 \vee x_9) \\ w_6 &= (\neg x_5 \vee \neg x_6) \end{aligned}$$

3. Given the representation of the 2-Queens problem given in class (and reproduced below in a slightly different form), produce the search tree produced by DPLL with unit propagation to show whether the propositional formula is satisfiable or unsatisfiable. You must provide enough annotation to show how this tree is produced. Suggested annotation: (follow the annotation style in the lecture slides): show in the tree the valuation given for each decision node (give the valuation on the left and right branch); provide the unit propagation values for unit variables beside the tree branch; show whether the tree can be expanded on the branch or whether it leads to a conflict (i.e., a failure, mark it with an X); list the clauses in the CNF form of the original formula and indicate which clauses are made true by the current valuation or made false by the current valuation (annotate appropriately, you will probably need two columns for each decision node, one for the left branch and one for the right branch).

$(a \vee b)$   
 $(\neg a \vee \neg b)$   
 $(c \vee d)$   
 $(\neg c \vee \neg d)$   
 $(a \vee d)$   
 $(\neg a \vee \neg d)$   
 $(b \vee c)$   
 $(\neg b \vee \neg c)$   
 $(\neg a \vee \neg c)$   
 $(\neg b \vee \neg d)$

4. Give the propositional formula that models the 3-Queens problem. Take this propositional formula, convert it to CNF (provide this a part of your answer) and give it as input to the SAT solver that you have installed on your computer. (If you don't have a computer tell me.) What is the answer given by the SAT solver? In addition to the items above, also submit the file containing the CNF version of the propositional formula and a screen shot of your Python run.
