Some important equivalences $(A \rightarrow \beta) \equiv (72 \vee \beta)$ $(A \vee 7A) \equiv T$

Contrapositive

- Let $A \rightarrow B$ be an **implication** (if A then B).
 - If a card has a J on one side then it has 5 on the other.
- Its contrapositive is $\neg B \rightarrow \neg A$.
 - If a card does not have 5 on one side then it cannot have J on the other.
- Contrapositive is equivalent to the original implication: $(A \rightarrow B) \equiv (\neg B \rightarrow \neg A)$
 - This is why we need to check cards with numbers other than 5
 - Proof: $\neg B \rightarrow \neg A \equiv \neg \neg B \lor \neg A \equiv B \lor \neg A$ $\equiv \neg A \lor B \equiv A \rightarrow B$

Converse and Inverse

- Let $A \rightarrow B$ be an **implication** (if A then B).
 - If a card has a J on one side then it has 5 on the other.
- Its converse is $B \rightarrow A$
 - If a card has 5 on one side, then it has J on the other.
- Its inverse is $\neg A \rightarrow \neg B$
 - If a card does not have J on one side, it cannot have 5 on the other.
- Converse is not equivalent to the original implication!
 - For A=true, B=false, $A \rightarrow B$ is false, but B → A is true.
- Converse is **not equivalent** to the negation of $A \rightarrow B$
 - For A=true, B=true, $B \rightarrow A$ is true, but $\neg (A \rightarrow B)$ is false.
- Converse is equivalent to the inverse. Why?
 - $-(\neg A \rightarrow \neg B)$ is the contrapositive of $(B \rightarrow A)$

Example $(P \vee (P \wedge 9)) \equiv$ (without using the absorption identity)

(pAT) v(pAq)) identity identity communitativity distribution $(P^{\Lambda}(T^{\Lambda}q))$ identity $(P\Lambda T)$ identity

Simplification of propositional wffs

Remove ->

Move - to propositional variables

and cancel -
Reduce number of propositional variables

Motivation = Logic in competer programs
eg., if (x>0 11 (x<=0) && y>100) Even further, we can analyze code (see Huth + Ryan)

- Logic gates (and, or, not) on a chip

Steps in simplification 1. Change (X -> B) to ((TX) VB) (remember (LMB) = (LAB) N (BB) 2. Move 7s to propositional variables and reduce number of propositional variables using logical equivalences (and other fautologies)

De Morgans Laws are very important because they move 7 from outside formula to inside formula

Simplifying formulas

- Start with the outermost connective and keep applying de Morgan's laws and double negation. Stop when all negations are on variables.
- Example 1: $(A \land C) \rightarrow (\neg B \lor C)$
 - By $(F \to G) \equiv (\neg F \lor G)$ (*let (A ∧ C) be F and $(\neg B \lor C)$ be G)
 - De Morgan's law
 - $\neg (A \land C)$ is equivalent to $(\neg A \lor \neg C)$
 - So the whole formula becomes
 - $\neg A \lor \neg C \lor \neg B \lor C$

•
$$\neg A \lor \neg C \lor \neg B \lor C$$
• $\equiv \neg A \lor \neg B \lor \neg C \lor C$ //commutativity
• but $\neg C \lor C$ is always **true**! Now we get $\neg A \lor \neg B \lor True$
• So the whole formula is *True*, a **tautology**.

• $\Rightarrow \neg A \lor \neg B \lor C$
• $\Rightarrow \neg A \lor \neg B \lor C$
• $\Rightarrow \neg A \lor \neg B \lor True$
• $\Rightarrow \neg A \lor \neg B \lor True$
• $\Rightarrow \neg A \lor \neg B \lor True$
• $\Rightarrow \neg A \lor \neg B \lor True$
• $\Rightarrow \neg A \lor \neg B \lor True$
• $\Rightarrow \neg A \lor \neg B \lor True$

• $\Rightarrow \neg A$

Simplifying formulas

```
• Example 2: \neg ((A \lor \neg B) \rightarrow (\neg A \land C))
```

```
• \equiv \neg (\neg (A \lor \neg B) \lor (\neg A \land C)) // \rightarrow

• \equiv \neg \neg (A \lor \neg B) \land \neg (\neg A \land C) // de Morgan to \lor

• \equiv (A \lor \neg B) \land \neg (\neg A \land C) // double negation

• \equiv (A \lor \neg B) \land (\neg \neg A \lor \neg C) //de Morgan to \land

• \equiv (A \lor \neg B) \land (A \lor \neg C) //double negation
```

• $\equiv A \vee (\neg B \wedge \neg C)$ //distributivity, taking A outside the parentheses

Simplifying formulas

```
• Example 3: (A \land \neg B) \rightarrow (A \lor B \rightarrow \neg B)

• \equiv \neg (A \land \neg B) \lor (A \lor B \rightarrow \neg B) // \rightarrow

• \equiv \neg (A \land \neg B) \lor (\neg (A \lor B) \lor \neg B) // \rightarrow

• \equiv (\neg A \lor \neg \neg B) \lor (\neg (A \lor B) \lor \neg B) //De Morgan to \land

• \equiv (\neg A \lor B) \lor (\neg (A \lor B) \lor \neg B) //double negation

• \equiv \neg A \lor B \lor \neg B \lor (\neg (A \lor B)) //associativity & commutativity

• \equiv \neg A \lor True \lor (\neg (A \lor B)) //law of the excluded middle

• \equiv True //identity
```

Normal Forms

Conjunctive Normal Form ((NF)
- conjunction of disjuncts (pv7gvr) 1 (7pv7g) 1 (7gV7r) Disjunctive Normal Form (DNF) -disjunction of conjuncts (PN9) V (PN-9N-11) V (91-11) Terminology (propositional) variable - P literal - P, 7P (a variable or a negated variable) clanse (or maxterm) - (PV7gVr) term (or minterm) - (PATT) 50, CNF is a conjunction of clauses that contain literals. We only look at CNF.

Every wff can be converted to its

CNF and its DNF

(i.e., the CNF and the DNF

are logically equivalent to

the original wff)

Convert to CNF

 $(Z \Leftrightarrow \beta) = (Z \Rightarrow \beta) \wedge (\beta \Rightarrow Z)$ 1. Remove

 $(d \rightarrow \beta) = (7d) \vee (\beta)$ 2. Remove ->

3. Use de Morgan's laws to make all negations literal negations or double negation

4. Remove touble negations

5. Use distributivity to get the correct form

Convert to CNF

```
• Example 2: \neg ((A \lor \neg B) \to (\neg A \land C))

• \equiv \neg (A \lor \neg B) \lor (\neg A \land C) // \rightarrow

• \equiv \neg \neg (A \lor \neg B) \land \neg (\neg A \land C) // de Morgan to \lor

• \equiv (A \lor \neg B) \land \neg (\neg A \land C) // double negation
```

•
$$\equiv (A \lor \neg B) \land (\neg \neg A \lor \neg C)$$
 //de Morgan to \land

•
$$\equiv (A \lor \neg B) \land (A \lor \neg C)$$
 //double negation
